

Machine learning Tek 5: simplicity bias of neural networks

learning curves: SGD, one hidden layer NN
input dim: 1, output dim: 1, n train samples: 40
hidden dim: 10

Data

Polynomial regression and overfitting

Neural network regression

We will perform regression on this data :

Figure – data

We have seen that polynomial regression without regularization can **overfit** :

Figure – Overfitting of a neural network with 26 parameters

Figure – Overfitting of a neural network with 27 parameters

Figure – With only 6 parameters, polynomial regression does not overfit.

Figure – Even with 400 parameters, this neural network trained with SGD did not overfit !

Exercise 1 : Implement neural network with 1 hidden layer, with a variable number of hidden neurons, and study the amount of overfitting, also as a function of the learning rate.

Figure – A neural network with 40 parameters

Learning curves

learning curves: SGD, one hidden layer NN
input dim: 1, output dim: 1, n train samples: 40
hidden dim: 10

Learning curves

learning curves: SGD, one hidden layer NN
input dim: 1, output dim: 1, n train samples: 40
hidden dim: 40

Learning curves

learning curves: SGD, one hidden layer NN
input dim: 1, output dim: 1, n train samples: 40
hidden dim: 200
